Chapter 4 n-grams and correlations

We use unnest_tokens function to tokenize the articles into consecutive sequences of words, called n-grams. Here we focus on bigrams, aka two consecutive words.

As one might expect, a lot of the most common bigrams are pairs of common (uninteresting) words, such as of the and to be: what we call "stop-words". This is a useful time to use tidyr's separate() and unite(), which splits a column into multiple based on a delimiter and reunite them. In this process we can remove cases where either is a stop-word.

Also, we clean the bigrams by str_extract() and filter() function to remove cases where either is NA, space or non-letter word.

Then we look at tf_idf of bigrams and visualize them.

## # A tibble: 10 x 6							
##		article	bigram	n	tf	idf	tf_idf
##		<chr></chr>	<chr></chr>	<int></int>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>
##	1	doc1	null hypothesis	21	0.0843	1.10	0.0927
##	2	doc1	null model	15	0.0602	1.10	0.0662
##	3	doc2	previous block	13	0.0478	1.10	0.0525
##	4	doc1	alternative model	7	0.0281	1.10	0.0309
##	5	doc2	previous hash	7	0.0257	1.10	0.0283
##	6	doc1	omniscient jones	6	0.0241	1.10	0.0265
##	7	doc1	sample size	6	0.0241	1.10	0.0265
##	8	doc1	significant result	6	0.0241	1.10	0.0265

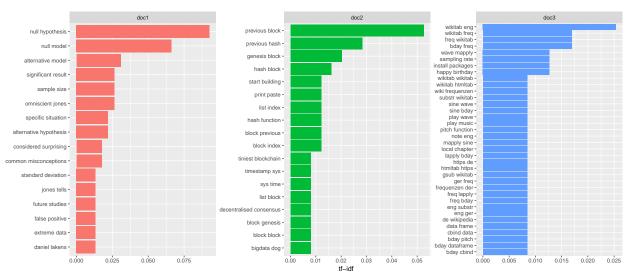

Figure: The 12 bigrams with the highest tf-idf

There are advantages and disadvantages to examining the tf-idf of bigrams rather than individual words. Pairs of consecutive words might capture structure that isn't present when one is just counting single words, and may provide context that makes tokens more understandable. However, the per-bigram counts are also sparser: a typical two-word pair is rarer than either of its component words. Thus, bigrams can be more useful when we have a larger text dataset.

• Using bigrams to provide context in sentiment analysis

```
## # A tibble: 0 x 4 ## # ... with 4 variables: word1 <chr>, word2 <chr>, score <int>, nn <int>
```

For these are three academic articles and there are not many bigrams with negative terms. So we can skip this part.

• Visualizing a network of bigrams with ggraph

```
## # A tibble: 6 x 3
##
     word1
                  word2
                                 n
     <chr>
##
