Correlaid_Text_Analysis

Xiang XU, Jing(Mira) Tang, Ningze(Summer) ZU, Jianhao(Miller) Yan November 3, 2018

Scraping webpages

We see here we scrap three articles from correlaid.com and combine them into aone data frame.

These three articles are :

* understand-p-values; * blockchain-explained; * music-with-r.

```
## 'data.frame': 3 obs. of 2 variables:
## $ article: chr "doc1" "doc2" "doc3"
```

\$ text : chr "Skip to main content\n\nToggle navigation Menu\n\n \bullet \n \bullet Zurück zu Correlaid.org\n \bullet 1

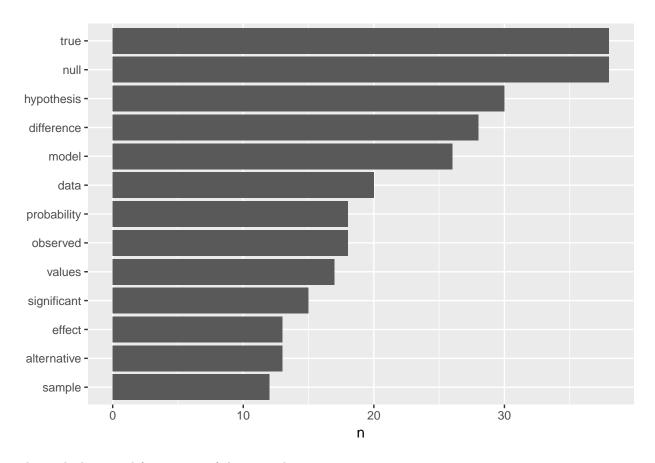

tidy text

We tidy the text by unnest_tokens function and filter the useful words, which make sense.

```
##

## 6
        doc1
```

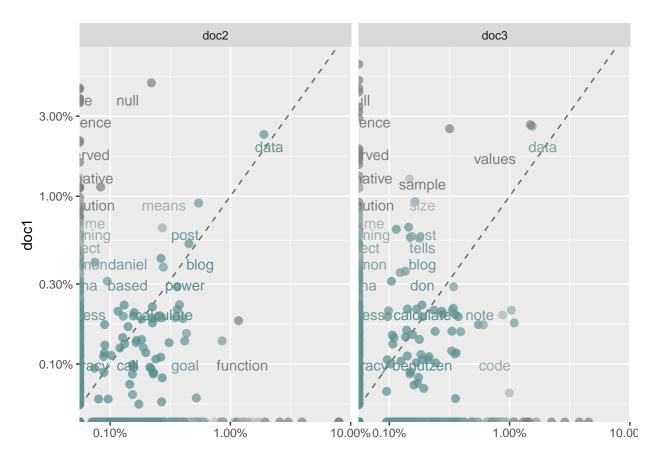

look at single word frequency and visualize

Here look at the first article p-value and cont word frequencies.

Then calculate word frequencies of three articles .

Plotting and comparing the three articles

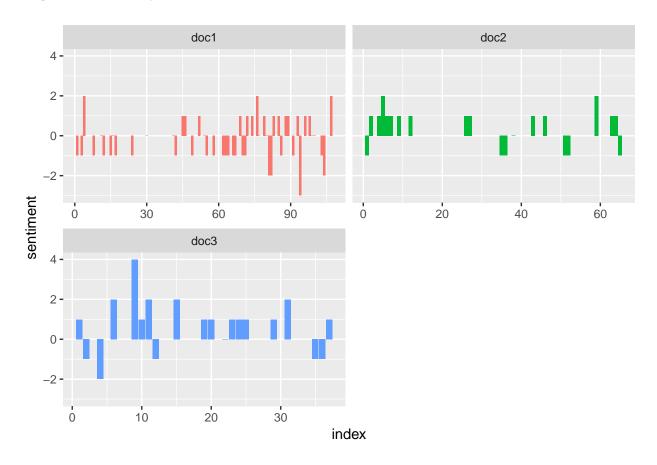

```
##
##
    Pearson's product-moment correlation
##
## data: proportion and doc1
## t = -0.90635, df = 800, p-value = 0.365
\#\# alternative hypothesis: true correlation is not equal to 0
  95 percent confidence interval:
    -0.10103135 0.03728257
##
   sample estimates:
##
           cor
   -0.03202772
##
##
    Pearson's product-moment correlation
##
## data: proportion and doc1
## t = -1.3419, df = 800, p-value = 0.18
## alternative hypothesis: true correlation is not equal to 0
## 95 percent confidence interval:
    -0.11623528 0.02191054
## sample estimates:
##
           cor
## -0.04738898
```

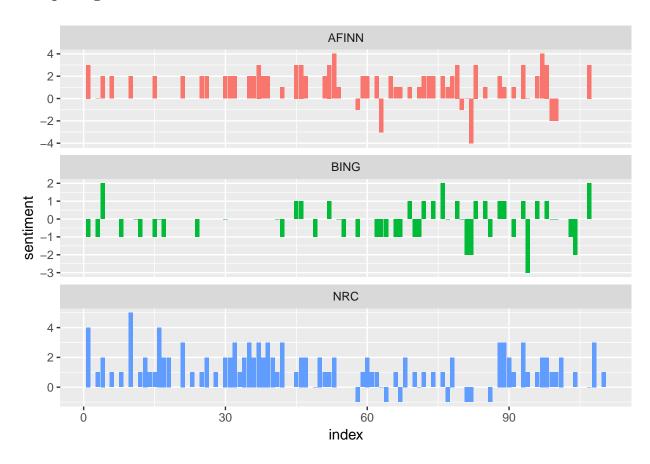

As we saw in the plots, the word frequencies have little frequencies in three articles.

n-grams and correlations

We use unnest_tokens function to tokenize the articles into consecutive sequences of words, called n-grams. Here we focus on bigrams, aka two consecutive words.

As one might expect, a lot of the most common bigrams are pairs of common (uninteresting) words, such as of the and to be: what we call "stop-words". This is a useful time to use tidyr's separate() and unite(), which splits a column into multiple based on a delimiter and reunite them. In this process we can remove cases where either is a stop-word.

Also, we clean the bigrams by str_extract() and filter() function to remove cases where either is NA, space or non-letter word.

Then we look at tf_idf of bigrams and visualize them.

## # A tibble: 10 x 6							
##		article	bigram	n	tf	idf	tf_idf
##		<chr></chr>	<chr></chr>	<int></int>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>
##	1	doc1	null hypothesis	21	0.0843	1.10	0.0927
##	2	doc1	null model	15	0.0602	1.10	0.0662
##	3	doc2	previous block	13	0.0478	1.10	0.0525
##	4	doc1	alternative model	7	0.0281	1.10	0.0309
##	5	doc2	previous hash	7	0.0257	1.10	0.0283
##	6	doc1	omniscient jones	6	0.0241	1.10	0.0265
##	7	doc1	sample size	6	0.0241	1.10	0.0265
##	8	doc1	significant result	6	0.0241	1.10	0.0265

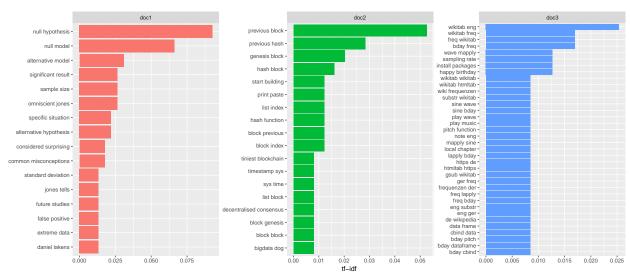

Figure: The 12 bigrams with the highest tf-idf

There are advantages and disadvantages to examining the tf-idf of bigrams rather than individual words. Pairs of consecutive words might capture structure that isn't present when one is just counting single words, and may provide context that makes tokens more understandable. However, the per-bigram counts are also sparser: a typical two-word pair is rarer than either of its component words. Thus, bigrams can be more useful when we have a larger text dataset.

• Using bigrams to provide context in sentiment analysis

```
## # A tibble: 0 x 4 ## # ... with 4 variables: word1 <chr>, word2 <chr>, score <int>, nn <int>
```

For these are three academic articles and there are not many bigrams with negative terms. So we can skip this part.

• Visualizing a network of bigrams with ggraph

```
## # A tibble: 6 x 3
##
     word1
                  word2
                                 n
     <chr>
##
                  <chr>
                              <int>
## 1 null
                  hypothesis
                                 21

• Pairwise correlation

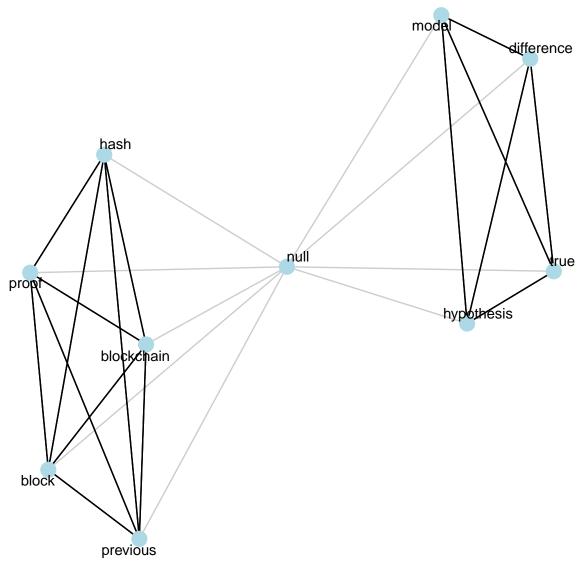

Find the phi coefficient between words based on how often they appear in the same article.

Distribution of probabilities for all topics

Distribution of probability for each topic

Summary

By using a combination of network analysis, tf-idf, and topic modeling, we have come to a greater understanding of how datasets are related in these three articles from correlaid website. Specifically, we have more information now about how keywords are connected to each other and which datasets are likely to be related. The topic model could be used to suggest keywords based on the words in the description field, or the work on the keywords could suggest the most important combination of keywords for certain areas of study.
